National Geographic Readers: Rocks and Minerals

By: Kathleen Weidner Zoehfeld

Introduce children to the exciting world of rocks and minerals, from dazzling gemstones to sparkling crystals to molten lava.

Rocks Are Everywhere

Walk outside and look around. You may see rocks right under your feet. Are they gray or black, tan or brown? They might be green, blue, white, pink, or even red.

Or maybe they sparkle with lots of different colors!

**Q**

What's a rock's favorite way to travel?

On a rocket!

A

公众号: Wecancan

Pick up the rocks. Do they feel smooth or rough? Are they heavy to hold? Or do they feel light

6

in your hands? Rocks look and feel the way they do because of the minerals in them.

7

Amazing Minerals

公众号: Wecanacan

All rocks are made up of minerals. Each mineral has its own special shape, called a crystal (KRIS-tal).

Geologists (jee-OL-uh-jists) have found many minerals on Earth. Some minerals are easy to find. Others are hard to find.

Words Rock

CRYSTAL: The shape a mineral takes in a rock when the rock forms

GEOLOGIST: A scientist who studies rocks

Easy to Find

quartz

mica

feldspar

Hard to Find

emerald

sapphire

gold

Mineral Mash-Up

公众号: Wecan

Q

What is a rock's favorite type of music?

Rock and roll!

A

Some rocks are made of just one mineral. But most rocks are made of two or more.

The mineral gold is often mixed with quartz.

Limestone is made of one mineral.

Pegmatite (PEG-muh-tite) is made of many minerals.

Rock Groups

公众号: Wecan

1 Igneous Rocks

Rocks can form in three different ways. So geologists put rocks in three groups:

- 1 **Igneous** (IG-nee-us)
- 2 **Sedimentary** (SED-uh-MEN-ter-ee)
- 3 **Metamorphic** (met-uh-MOR-fik)

Most of the rocks on our planet are igneous rocks. Igneous rocks begin to form deep inside the Earth. Here the rock is very hot. It is called magma (MAG-muh).

Words Rock

IGNEOUS ROCKS: Rocks that are formed by the cooling of super hot rocks

MAGMA: Hot, melted rock that forms inside the Earth and comes out as lava

Granite (GRAN-it)
forms when
magma cools slowly
underground.

Magma turns into
igneous rock when it
cools. Sometimes
magma cools slowly
underground.

Obsidian
(ob-SID-ee-an) forms
when lava cools
quickly above ground.

When volcanoes erupt,
magma pushes up
from underground.
Above ground, it
cools quickly.

These basalt rocks in Ireland
were formed millions of years
ago by lava from a volcano.

Magma that flows from
a volcano is called lava.

Sandstone is made up of grains of sand.

Words Rock

SEDIMENTARY ROCKS:
Rocks that are formed when many small pieces of rock are glued together

2 Sedimentary Rocks

Rocks are broken into small pieces by wind, rain, and ice. These pieces are called sediment.

Sediment is washed or blown into lakes and oceans. The sediment sinks. It builds up in layers on the bottom.

Minerals mixed in the water glue the rock together. This is one way sedimentary rock is formed.

Shale is made of layers of mud pressed together.

Conglomerate (con-GLOM-ur-it) is made of many things, including sand and pebbles.

3 Metamorphic Rocks

On Earth we stand on huge slabs of rock called tectonic (tek-TON-ik) plates. These plates are always moving, but most of the time we can't feel them move.

When plates move past each other or crash into each other, the rocks are heated up and squeezed. This changes the rocks.

They become metamorphic rocks.

Words Rock

METAMORPHIC ROCKS:
Rocks that have been changed through heating and squeezing

Sandstone (sedimentary) becomes quartzite (metamorphic).

Limestone (sedimentary) becomes marble (metamorphic).

Folded metamorphic rock layers in Italy

7 Cool Rock Facts

公众号: Wecan

Q

How do you help a pebble fall asleep?

You rock it!

A

1

The ancient Egyptians built the pyramids with limestone thousands of years ago. They still stand today.

2

Diamonds are the hardest minerals on Earth. They can even cut steel.

4

Some pumice rocks are so light they float on water.

5

The moon is made mostly of igneous rock.

6

A geode looks like a plain dull rock on the outside. Crack it open and there might be beautiful crystals hidden inside.

3

The softest mineral in the world is talc. You can crumble it with your fingers.

7

Obsidian feels as smooth as glass.

The Rock Cycle

Our Earth is like one giant rock factory. Old rocks are breaking into smaller and smaller pieces. New rocks are forming all the time.

On Earth, some things happen over and over again in the same order. This is called a cycle.

Fossils

公众号: Wecancan

Sometimes shells, bones, or other parts of living things get covered in sediment. Water seeps into tiny spaces in the bones or shells.

Minerals in the water are left behind. The bones or shells turn into fossils (FOS-uls). Fossils can be found in some sedimentary rocks.

A shell fossil

Q

How do stones do their laundry?

On the rock cycle!

A

A scientist at work taking dinosaur bones out of rock

Gemstones

公众号: Wecan

Gemstones have beautiful crystal shapes and colors. They are often made into jewelry.

A diamond in rock can be made into a dazzling ring.

diamond

A ruby in rock is cleaned and cut. Then it is a gem!

ruby

Here to Stay

公众号: Wecandian

Look around you at the buildings and roads. Do you see rocks? They are everywhere!

The walls of the Washington Monument are made mostly of white marble. The monument is the tallest stonework structure in the world.

Many things we build with rocks will still be standing years and years from now.

Stump Your Parents

公众号: Wecan

Can your parents answer these questions about rocks? You might know more than they do!

Answers are at the bottom of page 31.

What comes out of a volcano?

- A. pebbles
- B. lava
- C. sediment
- D. water

The cycle of old rocks turning into new rocks is called ____.

- A. the mineral cycle
- B. the sedimentary cycle
- C. the fossil cycle
- D. the rock cycle

What do you call a scientist who studies rocks?

- A. an astronomer
- B. a biologist
- C. a rock star
- D. a geologist

In what type of rock can you sometimes find fossils?

- A. igneous
- B. sedimentary
- C. metamorphic
- D. lava

Beautiful rock crystals can be made into ____.

- A. glitter
- B. rock candy
- C. gems
- D. toys

What are rocks made of?

- A. minerals
- B. seeds
- C. living things
- D. wood

What gives a rock, like this piece of malachite, its color?

- A. minerals
- B. paint
- C. seaweed
- D. crayons

Answers: 1) B, 2) D, 3) D, 4) B, 5) C, 6) A, 7) A

CRYSTAL: The shape a mineral takes in a rock when the rock forms

GEOLOGIST: A scientist who studies rocks

IGNEOUS ROCKS: Rocks that are formed by the cooling of super hot rocks

MAGMA: Hot, melted rock that forms inside the Earth and comes out as lava

METAMORPHIC ROCKS: Rocks that have been changed through heating and squeezing

SEDIMENTARY ROCKS: Rocks that are formed when many small pieces of rock are glued together
